

CIBOP — Equity Module

Video Production Document

Modules D4.1 – D4.8 | Anime Character Style | Full Production Script

CHARACTER KEY

Code	Character	Description	Typical Role
RYO	Male — Anime Professional	Navy blue suit, glasses, calm confident expression. Mid-30s professional anime style.	Expert explainer, mentor figure, experienced market professional
ARIA	Female — Anime Professional	Smart teal blazer, confident posture, modern professional anime style. Late-20s.	Curious analyst, learner voice, asks the right questions
BOTH	Ryo + Aria	Both characters on screen in split or dialogue format.	Dialogue segments, compare/contrast sections
MOTION	Motion Graphics	No character on screen. Animated diagrams, icons, data visuals, flowcharts.	Concept explainers, formula demos, comparison visuals

DOCUMENT GUIDE

Element	What It Means
 Internal Mapping Table	UOR code, competency, EAR, objective, prerequisite. For curriculum team use only — not visible to learners.
 Production Table	Scene-by-scene: Character Visual Cue On-Screen Text Voice Over. For animation studio and developer use.
 NEW CONTENT	Fully developed videos for content gaps identified in review (OFS, Types of Preference Shares, Share Capital Structure, Types of Market Cap, Sponsored/Unsponsored DRs).
► Transition Card	Appears at the end of every video — tells the developer which micro-video plays next. Enables seamless sequential flow.

Why Equity Exists — EAR: IDENTIFY

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.1-A
UOR Title	Why Equity Exists
Competency	Equity Purpose & Ownership Reasoning
Sub-competencies	—
EAR Focus	IDENTIFY — Identify equity as ownership
Video Objective	Identify what equity fundamentally represents Recognise equity as ownership, not just funding Distinguish equity from 'just money raised'
Prerequisite	None (Entry point)
Leads To	UOR D4.1-B — EAR: DIFFERENTIATE

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Animated title card — bold text 'Why Does Equity Exist?' sweeps in Dark gradient background with subtle financial grid lines	WHY DOES EQUITY EXIST? Module 4.1 Video 1 of 3	Every company needs capital to grow. But how that capital is raised changes everything.
2	RYO	Ryo centre frame, navy suit, thoughtful expression Clean office background with soft bokeh financial charts		Let me ask you something. If you give me ₹10 lakh as a loan, what are you to me?

3	MOTION	ICON: Coin stack with arrow → person silhouette labelled 'LENDER' Clean white animation, icon pops in with bounce effect	YOU ARE A LENDER	You're a lender. You expect repayment. Plus interest.
4	RYO	Ryo leans forward slightly, eyebrow raised — subtle expression shift		But if you give me ₹10 lakh and I give you 10% of my company... Now what are you?
5	MOTION	ICON: Coin stack → company building with ownership badge '10%' 'LENDER' text crosses out, 'OWNER' slides in with glow effect	YOU ARE AN OWNER 10% Stake	You're not a lender anymore. You're an owner. And that difference — is everything.
6	RYO	Ryo standing confident, slight smile, arms slightly open	EQUITY = OWNERSHIP	When a company raises equity, it is not borrowing money. It is selling ownership.
7	MOTION	Split animation — 4 icons appear one by one with labels Shareholders Voting Rights Dividends (not mandatory) Business Risk (including market risk)	EQUITY MEANS... • Investors become shareholders • Voting rights • Profits via dividends (not mandatory) • Shared business risk (including market risk)	That means investors become shareholders. They get voting rights. They share in profits in the form of dividends — though dividends are not mandatory. And they bear business risk, which includes market risk.
8	RYO	Ryo, calm, measured delivery	NO REPAYMENT OBLIGATION = Transfer of Ownership Stake	Equity is not a repayment obligation. It is a transfer of ownership stake.
9	MOTION	Two columns animate in: DEBT (chain icon) vs EQUITY (handshake icon) Debt column: 'Keeps ownership intact' Equity column: 'Changes who owns the company'	DEBT → Ownership Intact EQUITY → Ownership Changes	Companies issue equity when they are willing to share control, share upside, and share risk. Debt instruments keep ownership intact. Equity changes who owns the company.
10	RYO	Ryo turns slightly, arrow graphic appears pointing right — teaser for next video	NEXT: Equity vs Debt — What's the structural difference?	So now the question becomes: if equity means ownership and debt means borrowing — how exactly are they different in structure and consequence? That's what we'll explore next.

► **MICRO-VIDEO TRANSITION**

Leads directly to: D4.1 Video 2 — EAR: DIFFERENTIATE | Equity vs Debt

D4.1 · Video 2 of 3

Equity vs Debt — EAR: DIFFERENTIATE

 INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.1-B
UOR Title	Why Equity Exists
Competency	Equity Purpose & Ownership Reasoning
Sub-competencies	—
EAR Focus	DIFFERENTIATE — Equity from debt structurally
Video Objective	Differentiate equity vs debt structurally Identify repayment obligation differences Recognise impact on control and risk
Prerequisite	UOR D4.1-A
Leads To	UOR D4.1-C — EAR: EXPLAIN

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title card — 'Equity vs Debt' with two-tone split background Left: warm amber (equity), Right: cool blue (debt)	EQUITY vs DEBT D4.1 Video 2 of 3	We know equity means ownership. Now let's understand the structural difference between equity and debt.
2	BOTH	Aria left frame — curious analyst posture, slight tilt Ryo right frame — grounded, professional stance Split screen dialogue format		ARIA: So if both equity and debt bring money into the company — why not just borrow every time? RYO: Because borrowing creates obligation. Equity creates ownership.

3	BOTH	Aria nods, expression: engaged, leaning in slightly		ARIA: Obligation in what sense? RYO: Great question. Let me show you.
4	MOTION	DEBT column builds up item by item — each item drops in with a lock icon 1. Repay principal 2. Pay interest 3. Even if business fails	DEBT OBLIGATIONS X Must repay principal X Must pay interest X Even when business performs poorly	With debt: you must repay the principal. You must pay interest. Even if your business performs poorly.
5	MOTION	EQUITY column builds up — each item slides in with a unlock/freedom icon 1. No mandatory repayment 2. No fixed interest 3. Investors earn only if business performs	EQUITY — NO OBLIGATION ✓ No mandatory repayment (equity is permanent capital) ✓ No fixed interest ✓ Investors earn (Capital Appreciation) only if business performs ✓ Equity investors = residual claim holders	With equity: no mandatory repayment — equity is a permanent source of capital. No fixed interest. Investors earn, through capital appreciation, only if the business performs. Equity investors are residual claim holders on the company's earnings and assets.
6	BOTH	Aria looks thoughtful, Ryo composed		ARIA: So debt is safer for investors? RYO: Safer in terms of repayment priority, yes.
7	MOTION	Liquidation priority waterfall animation — fills from top to bottom Layer 1: Debt Holders (blue) Layer 2: Shareholders (amber) — labelled 'Residual Value'	IF COMPANY FAILS: ① Debt holders paid first ② Shareholders get residual value	If the company fails — debt holders get paid first. Shareholders receive whatever remains — which could be very little.
8	BOTH	Aria surprised expression, Ryo nods calmly		ARIA: So equity investors take more risk? RYO: Yes. But they also get unlimited upside. Debt has capped returns. With equity — ideally, higher the risk, higher is the expected return.
9	MOTION	Summary split card — clean minimal design Left: DEBT formula Right: EQUITY formula	DEBT = Fixed Obligation + No Ownership EQUITY = Ownership + No Fixed Repayment	So to summarise: Debt equals fixed obligation plus no ownership. Equity equals ownership plus no fixed repayment.

10	RYO	Ryo centre frame, hand gesture pointing forward — bridge to next	NEXT: Why would a company choose equity over debt?	Now the real question is — why would a company choose one over the other? That's what we'll explain next.
----	-----	--	---	---

► MICRO-VIDEO TRANSITION

Leads directly to: D4.1 Video 3 — EAR: EXPLAIN | Why Companies Choose Equity

D4.1 · Video 3 of 3

Why Companies Choose Equity — EAR: EXPLAIN

 INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.1-C
UOR Title	Why Equity Exists
Competency	Equity Purpose & Ownership Reasoning
Sub-competencies	—
EAR Focus	EXPLAIN — Why companies choose equity instead of debt
Video Objective	Explain strategic reasons for raising equity Identify scenarios where equity makes sense Link capital structure choice to risk profile
Prerequisite	UOR D4.1-B
Leads To	UOR D4.2-A — Types of Equity & Rights

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title card: 'Why Companies Choose Equity' — strategic tone Background: subtle startup growth chart animation	WHY COMPANIES CHOOSE EQUITY D4.1 Video 3 of 3	We know what equity is. We know how it differs from debt. Now — why would a company actually choose it?
2	RYO	Ryo in advisory posture — leaning slightly, speaking to camera	IMAGINE: You are a startup founder	Imagine you are a startup founder. Your company is growing. But profits are unstable. Would a bank lend you ₹50 crore?
3	MOTION	Bank icon with X — 'Not yet' text appears Caption: Debt requires predictable cash flow	DEBT REQUIRES: Predictable Cash Flows	Maybe not. Because debt requires predictable cash flow. Banks need assurance of repayment. Startups often can't promise that.

			Repayment Certainty	
4	MOTION	5 numbered icons animate in one by one, each with a relevant icon 1-Cash flow 2-Interest 3-Expansion 4-Strategic investors (Note: point 5 removed per review)	COMPANIES CHOOSE EQUITY WHEN: ① Cash flows are uncertain ② Want to avoid fixed interest burden ③ Need large capital for expansion ④ Want strategic investors on board	This is where equity becomes powerful. Companies choose equity when: cash flows are uncertain, they want to avoid a fixed interest burden, they need large capital for expansion, or they want strategic investors who bring more than just money.
5	RYO	Ryo with weighing scales graphic — one side: ownership, other side: flexibility	THE TRADE-OFF Give up ownership But avoid default risk	Equity is expensive in one way — you give up ownership. But it is flexible in another — you don't risk default. That's the trade-off.
6	MOTION	Closing card — module summary, dots indicating 3 videos complete Teaser preview card for next UOR — Types of Equity	D4.1 COMPLETE ✓ NEXT MODULE: Types of Equity & Rights Common vs Preference Shares	If equity means ownership — what kind of ownership? Common? Preferred? Different rights? That's where the story continues.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.2 Video 1 — EAR: IDENTIFY | Common Share Features

D4.2 · Video 1 of 4

Common Share Features — EAR: IDENTIFY

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.2-A
UOR Title	Types of Equity & Rights
Competency	Instrument Differentiation
Sub-competencies	SC2.1 — Identify common share features
EAR Focus	IDENTIFY — Common share features, ownership and voting rights, residual claim
Video Objective	Identify key features of common shares Recognise ownership and voting rights Understand residual claim concept
Prerequisite	UOR D4.1-C
Leads To	UOR D4.2-B — Preference Share Features

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title card — 'Common Shares: What Are They?' animated heading Background: share certificate icon dissolves into person-plus-building icon	COMMON SHARES D4.2 Video 1 of 4	When most people say 'I bought shares', they usually mean common shares — because common shares are the most popular form of equity among investors.
2	RYO	Ryo, warm expression, conversational stance	COMMON SHARES = DEFAULT OWNERSHIP	Common shares are the default form of ownership. If you own common shares — you are a part-owner of the company.

3	MOTION	5 feature icons appear in sequence with labels — checklist style animation	IF YOU OWN COMMON SHARES: ✓ Part-owner of the company ✓ Typically have voting rights ✓ May receive dividends ✓ Benefit from capital appreciation ✓ Last in line in case of liquidation	You typically have voting rights. You may receive dividends. You benefit from capital appreciation. And you are last in line in the event of company liquidation.
4	RYO	Ryo with raised hand — 'pause and reflect' gesture	LET'S PAUSE ON THAT LAST POINT	Let's pause on that last point — last in line.
5	MOTION	Waterfall/queue animation — 3 layers with labels and % bars ① Debt Holders (full bar) ② Preference Shareholders ③ Common Shareholders (residual)	IF COMPANY SHUTS DOWN: ① Debt holders paid first ② Preference shareholders paid next ③ Common shareholders — residual	If the company shuts down: debt holders are paid first. Preference shareholders are paid next. Common shareholders receive whatever remains. That's why they are called residual claimants.
6	RYO	Ryo, confident energy — reinforcing the trade-off	HIGHEST RISK → UNLIMITED UPSIDE	They take the highest risk. But they also get unlimited upside.
7	ARIA	Aria enters frame from right — bridge moment	NEXT: What if you want stability over growth?	So common shares give you control and upside. But what if you want more income stability and less volatility? That's where preference shares enter.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.2 Video 2 — EAR: IDENTIFY | Preference Share Features

D4.2 · Video 2 of 4

Preference Share Features — EAR: IDENTIFY

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.2-B
UOR Title	Types of Equity & Rights
Competency	Instrument Differentiation
Sub-competencies	SC2.2 — Identify preference share features
EAR Focus	IDENTIFY — Preference share characteristics, dividend priority, limited voting rights
Video Objective	Identify preference share characteristics Understand dividend priority Recognise limited voting rights
Prerequisite	UOR D4.2-A
Leads To	UOR D4.2-C — Compare Rights & Structure

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title card: 'Preference Shares' — badge/priority icon animation	PREFERENCE SHARES D4.2 Video 2 of 4	Preference shares are also equity. But they are not the same as common shares.
2	BOTH	Aria left, Ryo right — dialogue format		ARIA: So preference shares are also equity. But are they the same as common shares? RYO: Not quite. Preference shares sit between debt and equity. They are a hybrid.
3	MOTION	Hybrid bar animation — debt on left (blue), equity on right (amber)	PREFERENCE SHARES = HYBRID Between Debt and Equity	Preference shares are a hybrid between debt and equity — combining features of both.

		Preference shares zone highlighted in middle (purple)		
4	MOTION	4 feature cards pop in — each with a distinct icon	PREFERENCE SHARES OFFER: ✓ Fixed dividend rate ✓ Priority over common in dividend payment ✓ Priority in liquidation (over common shares) ✗ Usually no voting rights	They usually offer: a fixed dividend rate, priority over common shares in dividend payment, priority in case of liquidation over common shareholders, and usually — no voting rights.
5	BOTH	Aria: questioning expression Ryo: measured, clear response		ARIA: So they're safer? RYO: Safer than common shares, yes. But riskier than debt.
6	MOTION	Priority stack re-appears with 3 tiers clearly labelled Debt (top/safest) Preference (middle) Common (bottom/riskiest)	SAFETY HIERARCHY: ① Debt — Paid first in liquidation ② Preference Shares — After debt, before common ③ Common Shares — Residual only	Preference shares are riskier than debt because in the event of company liquidation, debt holders are paid out completely before preference shareholders receive anything. They sit in between.
7	RYO	Ryo with 'preference' label with crown icon	'Preference' = Priority over COMMON shareholders	That's why they're called preference — they get preference over common shareholders. But not over debt.
8	ARIA	Aria gestures towards next section — bridge	NEXT: Let's compare them side by side	So now we've identified both. But identification is not enough. Let's compare them structurally.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.2 Video 3 — EAR: COMPARE | Rights & Structure

D4.2 · Video 3 of 4

Compare Rights & Structure — EAR: COMPARE

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.2-C
UOR Title	Types of Equity & Rights
Competency	Instrument Differentiation
Sub-competencies	SC2.3 — Compare rights
EAR Focus	COMPARE — Voting rights, dividend, liquidation priority, risk-return
Video Objective	Compare voting rights Compare dividend treatment Compare liquidation priority Understand risk-return difference
Prerequisite	UOR D4.2-B
Leads To	UOR D4.2-D — EAR: JUSTIFY Investor Suitability

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Common vs Preference — Side by Side' 3-column board animates in: CONTROL INCOME RISK	COMMON vs PREFERENCE Control Income Risk	We've identified both types. Now let's compare them structurally — side by side.
2	MOTION	Voting Rights row — two cells animate in Common: Tick (green) Preference: Cross or 'Usually No' (grey)	VOTING RIGHTS Common Shareholders: ✓ Yes Preference Shareholders: X Usually No	First — voting rights. Common shareholders typically have voting rights. Preference shareholders usually do not.

3	MOTION	Dividend row — two contrasting cells Common: wavy line (variable) Preference: flat line (fixed)	DIVIDEND Common: Variable — not guaranteed Preference: Fixed rate — paid first	Second — dividends. For common shares, dividends are variable and not guaranteed. For preference shares, the dividend is a fixed rate and is paid before common shareholders receive anything.
4	MOTION	Liquidation queue animation — labels drop into queue Common: dashes to end Preference: moves ahead of common	LIQUIDATION PRIORITY Common: Last in line Preference: Before common shareholders	Third — liquidation. Common shareholders are last in line. Preference shareholders come before common, but still after debt holders.
5	MOTION	Risk-Return spectrum bar — Common on right (high risk/high return), Preference centre-left	RISK & RETURN Common: High Risk → High Upside Preference: Moderate Risk → Capped Return	And finally — risk and return. Common shares carry high risk but offer potentially high upside. Preference shares carry moderate risk with a capped return.
6	RYO	Ryo with clean summary card visual behind him	COMMON = Control + Upside PREFERENCE = Priority + Stability	So the difference is simple: Common equals control plus upside. Preference equals priority plus stability.
7	ARIA	Aria, engaged expression — teases next video	NEXT: Who should invest in which?	But now comes the most important question — who should invest in which? That's what we'll justify next.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.2 Video 4 — EAR: JUSTIFY | Investor Suitability

D4.2 · Video 4 of 4

Investor Suitability — EAR: JUSTIFY

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.2-D
UOR Title	Types of Equity & Rights
Competency	Instrument Differentiation
Sub-competencies	SC2.1–SC2.3
EAR Focus	JUSTIFY — Which investor type suits which instrument
Video Objective	Justify which investor type suits common shares Justify which investor type suits preference shares Link instrument choice to risk appetite
Prerequisite	UOR D4.2-C
Leads To	UOR D4.2-E (NEW) — Types of Preference Shares

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Who Should Invest in Which?' — two investor silhouettes animate in	INVESTOR SUITABILITY D4.2 Video 4 of 4	Let's imagine two investors.
2	MOTION	Investor A profile card builds up — young character icon Traits list appears one by one with icons	INVESTOR A: • Young investor • Long investment horizon • High risk appetite • Wants capital growth	Investor A: young, with a long investment horizon, high risk appetite, and wants capital growth.
3	MOTION	Investor B profile card — mature professional icon	INVESTOR B: • Retired investor	Investor B: retired, wants stable income, low risk appetite, less concerned about voting.

		Traits list appears with contrasting icons	• Wants stable income • Low risk appetite • Less concerned about voting	
4	RYO	Ryo in advisory tone, calm delivery	COMMON SHARES → INVESTOR A	Who should buy common shares? Investor A. Because they benefit from long-term capital appreciation and can tolerate volatility.
5	RYO	Ryo slight shift — reinforcing preference logic	PREFERENCE SHARES → INVESTOR B	Who should buy preference shares? Investor B. Because preference shares offer fixed dividend, priority income, and lower volatility than common shares.
6	MOTION	Final 4-factor decision matrix — circles with icons Risk tolerance Income need Investment horizon Desire for control	SUITABILITY DEPENDS ON: ① Risk tolerance ② Income need ③ Investment horizon ④ Desire for control	So investor suitability depends on four things: risk tolerance, income need, investment horizon, and desire for control. That's the justification layer.
7	ARIA	Aria with a slight forward lean — bridge to types	NEXT: Types of Preference Shares — there's more than one kind!	But before we move on — preference shares are not all the same. There are multiple types. Let's explore them.

► **MICRO-VIDEO TRANSITION**

Leads directly to: D4.2 Video 5 (NEW) — Types of Preference Shares

D4.2 (NEW) · Video 5 of 5 — NEW CONTENT

Types of Preference Shares

NEW NEW CONTENT — Developed to fill identified gap

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.2-E (NEW)
UOR Title	Types of Preference Shares
Competency	Instrument Differentiation
Sub-competencies	SC2.2 Extended — Classify types of preference shares
EAR Focus	CLASSIFY — Cumulative, Redeemable, Participating, Convertible Preference Shares
Video Objective	Classify the four main types of preference shares Understand what makes each type distinct Connect type to investor use case
Prerequisite	UOR D4.2-D
Leads To	UOR D4.2-F (NEW) — Structure of Share Capital

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title card: 'Types of Preference Shares' — 4 coloured blocks appear	TYPES OF PREFERENCE SHARES D4.2 Video 5 — New Content	Preference shares are not one-size-fits-all. There are four key types, each with different features and investor implications.
2	MOTION	Block 1 highlight — Cumulative vs Non-Cumulative Calendar with accumulating coins animation	TYPE 1: CUMULATIVE vs NON-CUMULATIVE Cumulative: Unpaid dividends carry forward	Type one: Cumulative vs Non-Cumulative. In cumulative preference shares, if the company cannot pay a dividend in one year, that dividend accumulates and must be paid in future years before common shareholders receive anything. Non-cumulative shares — if a dividend is skipped, it is lost.

			Non-Cumulative: Unpaid dividends lapse	
3	MOTION	Block 2 — Redeemable vs Irredeemable Clock/exit door icon animation	TYPE 2: REDEEMABLE vs IRREDEEMABLE Redeemable: Company can buy back at fixed date Irredeemable: No fixed maturity (like common shares)	Type two: Redeemable vs Irredeemable. Redeemable preference shares can be bought back by the company at a predetermined date or price. Irredeemable shares have no fixed maturity — they remain outstanding indefinitely, similar to common shares in that respect.
4	MOTION	Block 3 — Participating vs Non-Participating Two pie charts — one grows, one stays fixed	TYPE 3: PARTICIPATING vs NON-PARTICIPATING Participating: Fixed dividend + share in extra profits Non-Participating: Fixed dividend only	Type three: Participating vs Non-Participating. Participating preference shareholders receive their fixed dividend — and if the company performs exceptionally well, they also participate in additional profit distributions. Non-participating shareholders receive only their fixed dividend, nothing more.
5	MOTION	Block 4 — Convertible vs Non-Convertible Transformation animation: bond-like icon → common share icon	TYPE 4: CONVERTIBLE vs NON-CONVERTIBLE Convertible: Can convert to common shares Non-Convertible: Remains as preference shares	Type four: Convertible vs Non-Convertible. Convertible preference shares can be converted into common shares at a predefined conversion ratio after a specified period. This gives investors the upside of equity if the company grows well. Non-convertible shares remain as preference shares permanently.
6	RYO	Ryo with summary grid behind him	REMEMBER: Preference shares can combine types e.g. Cumulative + Redeemable + Non-Participating	Important to note — a preference share can combine these features. For example, a share can be cumulative, redeemable, and non-participating all at once. The specific terms are defined in the company's Articles of Association.
7	ARIA	Aria — bridge to share capital structure	NEXT: Structure of Share Capital	Now that we understand types of shares — let's understand how share capital itself is structured.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.2 Video 6 (NEW) — Structure of Share Capital

D4.2 (NEW) · Video 6 of 6 — NEW CONTENT

Structure of Share Capital

NEW NEW CONTENT — Developed to fill identified gap

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.2-F (NEW)
UOR Title	Structure of Share Capital
Competency	Instrument Differentiation
Sub-competencies	SC2.4 (New) — Identify components of share capital
EAR Focus	IDENTIFY — Authorized, Issued, Subscribed, Paid-up Capital
Video Objective	Identify the four layers of share capital Understand the relationship between each layer Recognise why paid-up capital matters to investors
Prerequisite	UOR D4.2-E
Leads To	UOR D4.3-A — Primary Market

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title card: 'Structure of Share Capital' — nested box animation	STRUCTURE OF SHARE CAPITAL D4.2 Video 6 — New Content	When a company is formed, it defines how much share capital it can issue. But there are different layers to that structure — each with a distinct meaning.
2	MOTION	Nested concentric rectangles animate from outside in Outer: Authorized Next: Issued Next: Subscribed Inner: Paid-up	SHARE CAPITAL LAYERS: Authorized → Issued → Subscribed → Paid-up	Think of share capital as a set of nested boxes — from the maximum permitted, down to the actual cash received.

3	RYO	Ryo explaining each level — motion graphic beside him	AUTHORIZED CAPITAL Maximum capital a company is permitted to raise	Authorized capital is the maximum amount of share capital a company is legally permitted to raise, as stated in its Memorandum of Association. It's the ceiling.
4	MOTION	Issued capital box highlights — portion of authorized block shades in	ISSUED CAPITAL Portion of authorized capital actually offered to investors	Issued capital is the portion of authorized capital that the company has actually offered to investors through share issuance. A company need not issue all of its authorized capital at once.
5	RYO	Ryo gestures to subscribed level	SUBSCRIBED CAPITAL Portion of issued shares that investors have agreed to take up	Subscribed capital is the portion of issued capital that investors have formally agreed to purchase. In a successful IPO, subscribed capital equals or exceeds issued capital.
6	MOTION	Final inner box highlights — coins fill in to represent actual cash	PAID-UP CAPITAL Cash actually received by the company from shareholders	Paid-up capital is the actual cash received by the company from shareholders. This is the most important number for investors — it reflects what has truly been invested into the business.
7	MOTION	Clean comparison table: all 4 layers with example numbers in ₹ crore	EXAMPLE: Authorized: ₹100 Cr Issued: ₹80 Cr Subscribed: ₹80 Cr Paid-up: ₹75 Cr	For example: a company may have authorized capital of ₹100 crore, issue ₹80 crore worth of shares, receive subscriptions for all ₹80 crore, but only have ₹75 crore paid up — if some shareholders have been given time to pay the balance.
8	ARIA	Aria — bridge to primary market	NEXT: Primary Market — How are shares first issued?	Now that we understand share structure — where does this issuance happen? That's the primary market. Let's explore that next.

UOR Title	Primary vs Secondary Market
Competency	Market Structure Reasoning
Sub-competencies	SC3.1 — Identify primary market activity
EAR Focus	IDENTIFY — Primary market activity, when money flows to the company, IPO/FPO context
Video Objective	Identify what qualifies as primary market activity Recognise when money flows to the company Understand IPO/FPO/Rights Issue/OFS context
Prerequisite	UOR D4.2-F
Leads To	UOR D4.3-B — Secondary Market

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Primary Market' — money flow animation (company ← investor)	THE PRIMARY MARKET D4.3 Video 1 of 4	Let me ask you a question. When you buy shares on the stock exchange — does the company receive that money?
2	ARIA	Aria with confident expression, looking to camera	COMMON ASSUMPTION: Yes, the company gets the money	Most people say yes. But the answer is no. That transaction happens in the secondary market.
3	RYO	Ryo steps in — corrective gesture	WHEN DOES THE COMPANY RECEIVE MONEY? → Only in the PRIMARY MARKET	The company receives money only when securities are issued for the first time in the primary market.

4	MOTION	Arrow graphic: Investor → Company (money flows TO company) Label: PRIMARY MARKET	PRIMARY MARKET: Company ← Investor Company receives fresh capital	The primary market is where new securities are issued to investors. This is where fresh capital actually flows to the company.
5	MOTION	4 example icons appear with labels — each pops in with a brief highlight	PRIMARY MARKET EXAMPLES: • IPO — Initial Public Offering • FPO — Follow-on Public Offering • Rights Issue • Private Placement	Examples include: IPO — Initial Public Offering. FPO — Follow-on Public Offering. Rights Issue — offered to existing shareholders. Private Placement — to select institutional investors. In all these cases, the company is raising fresh capital through the issue and origination of new securities.
6	RYO	Ryo with key rule — simple, clean	KEY SIGNAL: 👉 Money flows TO the company = Primary Market	The key signal is simple: if money flows to the company — it is a primary market transaction.
7	ARIA	Aria — bridge to OFS and secondary	NEXT: But wait — what about OFS? And what is the secondary market?	Once shares are issued — they don't just disappear. They begin trading. And that brings us to the secondary market. But first — a special case you need to know: the Offer for Sale.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.3 Video 2 (NEW) — OFS: Offer for Sale

D4.3 (NEW) · Video 2 of 4 — NEW CONTENT

Offer for Sale (OFS)

NEW NEW CONTENT — Developed to fill identified gap

 INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.3-A2 (NEW)
UOR Title	Primary vs Secondary Market
Competency	Market Structure Reasoning
Sub-competencies	SC3.1 Extended — OFS vs IPO distinction
EAR Focus	IDENTIFY & DIFFERENTIATE — OFS vs IPO / FPO
Video Objective	Identify what an OFS is Differentiate OFS from IPO and FPO Understand who benefits from OFS proceeds
Prerequisite	UOR D4.3-A
Leads To	UOR D4.3-B — Secondary Market

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title card: 'OFS — Offer for Sale' — question mark animation then reveal	OFFER FOR SALE (OFS) D4.3 Video 2 — New Content	There's a transaction type that often confuses learners — the Offer for Sale, or OFS. It looks like a primary market event — but it isn't.
2	RYO	Ryo in clear, analytical mode	OFS = Existing shareholders sell their shares	In an OFS, existing shareholders — typically promoters or private equity investors — sell their existing shares to the public. The company itself does not issue new shares.
3	MOTION	Two-path animation: IPO path (Company → New Shares → Investors →	IPO/FPO: Money → COMPANY	In an IPO or FPO — money flows to the company. In an OFS — money flows to the selling shareholder,

		Money to Company) vs OFS path (Promoter → Existing Shares → Investors → Money to Promoter)	OFS: Money → SELLING SHAREHOLDER	not the company. The company raises zero fresh capital.
4	ARIA	Aria — curious, adds a practical example	WHY DO PROMOTERS USE OFS? • To reduce stake (regulatory compliance) • To provide exit to PE investors • Faster than a full IPO process	Why would promoters use OFS? To reduce their stake to comply with minimum public shareholding norms. To provide an exit to early investors. And because OFS is faster and cheaper than a full public offering.
5	RYO	Ryo — crisp summary	OFS SUMMARY: ✓ Existing shares sold — no new shares ✓ Money goes to selling shareholder ✗ Company does NOT raise fresh capital	To summarise: OFS involves existing shares — no new shares are created. Money goes to the selling shareholder. The company does not raise fresh capital. This is the critical distinction.
6	ARIA	Aria — bridge to secondary market	NEXT: Secondary Market — Investors trading among themselves	Now that we understand how shares enter the market — let's look at what happens after that. The secondary market.

Video Objective	Identify secondary market transactions Differentiate primary vs secondary using money flow logic Recognise liquidity function
Prerequisite	UOR D4.3-A2
Leads To	UOR D4.3-C — Why Secondary Markets Matter

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Secondary Market' — two investor silhouettes trading arrows between them	THE SECONDARY MARKET D4.3 Video 3 of 4	You bought shares in an IPO. A month later, you sell those shares on the stock exchange. Does the company receive money again?
2	ARIA	Aria shakes head — knowing expression	NO. The company is NOT involved.	No. In the secondary market, investors trade among themselves. The company is not involved.
3	MOTION	Two-arrow visual: Primary (Company ↔ Investor) vs Secondary (Investor ↔ Investor)	PRIMARY: Company ↔ Investor (Company gets money) SECONDARY: Investor ↔ Investor	Primary market: company and investor exchange — company gets money. Secondary market: investor and investor exchange — company does not get money. The stock exchange is part of the secondary market.

		Stock exchange building icon highlights as 'Secondary Market'	(Company gets nothing)	
4	RYO	Ryo with one-question test framework	ONE QUESTION TO DIFFERENTIATE: 👉 Who receives the money? Company → Primary Another Investor → Secondary	Ask one question: who receives the money? If the company receives it — primary. If another investor receives it — secondary. That is the structural distinction.
5	ARIA	Aria — bridge to explanation of why secondary exists	NEXT: Why does the secondary market even exist?	But then — why does the secondary market exist at all? Why not just stop after the IPO? That's the deeper layer.

Why Secondary Markets Matter — EAR: EXPLAIN

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.3-C
UOR Title	Primary vs Secondary Market
Competency	Market Structure Reasoning
Sub-competencies	SC3.1 + SC3.2 combined
EAR Focus	EXPLAIN — Secondary markets create liquidity, liquidity encourages primary investment
Video Objective	Explain why secondary markets create liquidity Understand why liquidity encourages primary investment Connect both markets structurally
Prerequisite	UOR D4.3-B
Leads To	UOR D4.4-A — Market Capitalisation: Compute

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	RYO	Ryo in reflective, conceptual mode — slightly different lighting	WHY DOES THE SECONDARY MARKET EXIST?	Here's the deeper question. If companies only raise money in the primary market — why do we need the secondary market at all?
2	MOTION	Lock icon on shares → key unlocks → liquidity flow animation	LIQUIDITY = Ability to convert investment to cash quickly	Because investors need liquidity. Liquidity means the ability to convert your investment into cash quickly.
3	ARIA	Aria with a hypothetical framing — expressive	IMAGINE: You must hold your IPO shares FOREVER... Would you still invest?	Imagine if you bought shares in an IPO but had to hold them forever. Would you invest? Probably not.

4	MOTION	Secondary market solves this — 3 benefit icons pop in	SECONDARY MARKET ALLOWS: • Continuous price discovery • Easy entry and exit • Liquidity for investors	The secondary market solves this problem. It allows continuous price discovery, easy entry and exit, and liquidity for investors.
5	RYO	Ryo — key insight delivery	WITHOUT SECONDARY MARKET → PRIMARY MARKET STRUGGLES	And here is the key insight: without a strong secondary market, the primary market would struggle. Because investors are willing to buy in IPOs only if they know they can exit later.
6	MOTION	Ecosystem loop animation: Primary (raises capital) → Secondary (provides liquidity) → back to Primary (enables more capital formation)	PRIMARY → raises capital SECONDARY → provides liquidity LIQUIDITY → encourages capital formation This is the ECOSYSTEM	So: primary market raises capital. Secondary market provides liquidity. Liquidity encourages capital formation. That is the ecosystem.
7	ARIA	Aria — bridge to market cap	NEXT: Equity Value & Market Capitalisation	Now that we understand how equity moves through markets — how do we actually measure the value of equity? That brings us to market capitalisation.

Video Objective	Correctly compute market capitalisation Identify required inputs Avoid common calculation errors
Prerequisite	UOR D4.3-C
Leads To	UOR D4.4-B — What Market Cap Represents

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Market Capitalisation' — formula animation builds up	MARKET CAPITALISATION D4.4 Video 1 of 4	Let's start simple. What is market capitalisation?
2	RYO	Ryo with formula appearing beside him	Market Cap = Current Market Price per Share × Total Outstanding Shares	It is the total market value of a company's outstanding equity shares. The formula is straightforward: Market Capitalisation equals Current Market Price per Share multiplied by Total Outstanding Shares.
3	MOTION	Worked example animates step by step on a clean board	EXAMPLE: Current Market Price = ₹200	Let's take an example. Current Market Price of the share is ₹200. Outstanding shares are 1 crore.

		$\text{₹}200 \times 1,00,00,000 = \text{₹}200 \text{ Cr}$	Outstanding Shares = 1 crore Market Cap = ₹200 × 1,00,00,000 = ₹200 Crore	Market cap equals ₹200 multiplied by 1 crore — which gives us ₹200 crore.
4	RYO	Ryo — important pause gesture	NOTICE: Market Cap is purely market-driven	Now pause. Notice something important. Market cap is purely market-driven. It reflects what the market is currently willing to pay for the company's equity.
5	ARIA	Aria — bridge to deeper meaning	NEXT: But what does this number actually MEAN?	But this is just computation. The deeper question is — what does this number actually mean?

► MICRO-VIDEO TRANSITION

Leads directly to: D4.4 Video 2 — EAR: EXPLAIN | What Market Cap Represents

D4.4 · Video 2 of 4

What Market Cap Represents — EAR: EXPLAIN

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.4-B
UOR Title	Equity Value & Market Cap
Competency	Equity Valuation Basics
Sub-competencies	SC4.2 — Explain market cap signals
EAR Focus	EXPLAIN — What market cap represents, investor perception, price movement
Video Objective	Explain what market cap signals Understand investor perception Link price movement to company valuation
Prerequisite	UOR D4.4-A
Leads To	UOR D4.4-C — What Market Cap Does NOT Represent

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	RYO	Ryo in conceptual mode — shift in tone from mechanical	WHAT DOES MARKET CAP REPRESENT?	Market cap represents the market's collective valuation of a company's equity. In simple terms — if someone wanted to buy all outstanding shares at current market price, this is what they would pay.
2	MOTION	'Market cap is NOT...' crosses out: Cash Amount raised Revenue Profit	MARKET CAP IS NOT: X Cash sitting in the company X Amount raised by the company X Revenue X Profit	But market cap is not cash sitting in the company. It is not the amount raised. It is not revenue. It is not profit.

3	MOTION	'Market cap IS...' with 4 factor icons: Growth Risk Industry Sentiment	MARKET CAP IS THE MARKET'S ASSESSMENT OF EQUITY VALUATION It reflects: • Growth expectations • Risk perception • Industry outlook • Investor sentiment	Market cap is the market's assessment of equity valuation. It reflects growth expectations, risk perception, industry outlook, and investor sentiment.
4	RYO	Ryo — forward-looking framing	MARKET CAP = FORWARD-LOOKING About EXPECTATIONS, not history	So market cap is a forward-looking indicator. It is about expectations. If investors believe a company has strong future potential — share price rises and market cap increases.
5	ARIA	Aria — teases the critical distinction coming	NEXT: Market Cap ≠ Total Company Value — Let's bust this myth	But here's the critical insight — market cap does not equal total company value. That's where most confusion happens. Let's address that next.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.4 Video 3 — EAR: INTERPRET | What Market Cap Does NOT Represent

Market Cap Misconceptions — EAR: INTERPRET

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.4-C
UOR Title	Equity Value & Market Cap
Competency	Equity Valuation Basics
Sub-competencies	SC4.3 — Distinguish equity value from enterprise value
EAR Focus	INTERPRET — Market cap correctly, equity value vs enterprise value, misconceptions
Video Objective	Interpret market cap correctly Distinguish equity value vs enterprise value Avoid common valuation misconceptions
Prerequisite	UOR D4.4-B
Leads To	UOR D4.4-D (NEW) — Types of Market Cap

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Market Cap Myths — Busted' — myth bubble animation	MARKET CAP MISCONCEPTIONS D4.4 Video 3 of 4	Let's clear a major misconception. Is market cap the total value of a company?
2	RYO	Ryo — measured, clear delivery	MARKET CAP = EQUITY VALUE ONLY (It ignores debt!)	Not exactly. Market cap reflects only the equity value. It ignores debt entirely.
3	MOTION	Simple company value breakdown animation Market Cap (₹200 Cr, amber) + Debt (₹100 Cr, blue) = Enterprise Value (₹300 Cr, combined)	EXAMPLE: Market Cap = ₹200 Cr + Debt = ₹100 Cr = Enterprise Value ≈ ₹300 Cr (simplified)	If a company has a market cap of ₹200 crore and debt of ₹100 crore — the actual value of the business to a buyer would be higher than ₹200 crore. This broader concept is called Enterprise Value.

			Market Cap alone UNDERSTATES true business value	
4	MOTION	Market cap rising animation — share price up arrow — but company balance sheet unchanged	IF MARKET CAP RISES — does the company get money? NO — unless NEW shares are issued	Another misconception: if market cap rises — does the company automatically receive money? No. Unless new shares are issued, price changes only affect shareholder wealth — not the company's balance sheet.
5	MOTION	Final summary — tick/cross comparison matrix	MARKET CAP REPRESENTS ✓ : Market perception Equity value Price × Shares MARKET CAP DOES NOT REPRESENT X : Cash held Profit Enterprise Value Amount raised historically	So to summarise: market cap represents market perception, equity value, and the product of price and shares. It does not represent cash held by the company, profit, enterprise value, or the total amount raised historically. That distinction is critical in investment banking.
6	ARIA	Aria — bridge to types of market cap	NEXT: Large Cap, Mid Cap, Small Cap — what do they mean?	Now that we understand market cap — companies are also categorised by their market cap size. Large cap, mid cap, small cap. Let's understand what those mean.

Field	Details
UOR Code	UOR D4.4-D (NEW)
UOR Title	Types of Market Capitalisation
Competency	Equity Valuation Basics
Sub-competencies	SC4.4 (New) — Classify companies by market cap size
EAR Focus	CLASSIFY — Large Cap, Mid Cap, Small Cap, Micro Cap
Video Objective	Classify companies by market cap category Understand SEBI definitions for Indian markets Link market cap category to risk-return profile
Prerequisite	UOR D4.4-C
Leads To	UOR D4.5-A — Equity as an Asset Class

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Types of Market Cap' — 4 sized circles appear, large to small	TYPES OF MARKET CAP D4.4 Video 4 — New Content	Companies are not just valued by market cap — they're categorised by it. And those categories matter for investors.
2	RYO	Ryo — clear, structured delivery	SEBI CLASSIFICATION (India): Large Cap: Top 100 companies by market cap Mid Cap: 101st to 250th	In India, SEBI defines these categories based on ranking by market cap. Large cap: the top 100 companies. Mid cap: the 101st to 250th. Small cap: 251st and below.

			Small Cap: 251st and below	
3	MOTION	Large cap block — Reliance, TCS, HDFC Bank icons — stable growth chart	LARGE CAP • Most established companies • Lower volatility • Moderate returns • Examples: Reliance, TCS, HDFC Bank	Large cap companies are the most established. They tend to have lower volatility, more predictable earnings, and moderate returns. Think Reliance Industries, TCS, HDFC Bank.
4	MOTION	Mid cap block — growing company icons — higher trajectory growth chart	MID CAP • Growing companies • Higher growth potential • Higher risk than large cap • Balance of stability and upside	Mid cap companies are typically in a growth phase. They offer higher growth potential than large caps — but come with higher risk. They balance stability and upside.
5	MOTION	Small cap block — startup-style icons — volatile chart pattern	SMALL CAP • Smaller, early-stage companies • Highest potential upside • Highest volatility and risk • Less liquidity	Small cap companies are smaller, often earlier-stage businesses. They offer the highest potential returns — but also the highest volatility, highest risk, and lower liquidity. Not for the faint-hearted.
6	RYO	Ryo with risk-return spectrum laid out	RISK-RETURN SPECTRUM: Small Cap → High Risk, High Return Mid Cap → Moderate Risk, Moderate Return Large Cap → Lower Risk, Stable Return	The pattern is consistent with what we've learned: higher potential return comes with higher risk. Small cap at one end, large cap at the other.
7	ARIA	Aria — bridge to asset class module	NEXT: Equity as an Asset Class — why does it matter?	Now that we understand equity markets deeply — let's step back and look at equity as a whole asset class, and why it sits at the core of capital markets.

UOR Title	Equity as an Asset Class
Competency	Equity Returns & Risk
Sub-competencies	SC5.1 — Explain equity return components
EAR Focus	EXPLAIN — Two components of equity returns, risk-return trade-off, growth capital
Video Objective	Explain the two components of equity returns Understand risk-return trade-off Recognise why equity is considered growth capital
Prerequisite	UOR D4.4-D
Leads To	UOR D4.5-B — Ownership Participation & Capital Market Role

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	ARIA	Aria in energetic, slightly elevated tone — growth and upside theme	HOW EQUITY GENERATES RETURNS From the Perspective of Equity Investors D4.5 Video 1 of 2	Let's look at equity from an investor's perspective. Why would anyone invest in equity? Because equity offers returns. And equity returns come from two sources.
2	MOTION	Two source icons appear: 1. Arrow up (Capital Appreciation) 2. Coin (Dividends)	TWO SOURCES OF EQUITY RETURNS: 1 Capital Appreciation 2 Dividends	First — Capital Appreciation. Second — Dividends. Let's break this down.

3	MOTION	Worked example — share price timeline: ₹100 → ₹130 (after 1 year) ₹30 gain highlighted, ₹5 dividend badge pops in	BUY at ₹100 After 1 Year: Price = ₹130 Capital Appreciation = ₹30 Dividend = ₹5 Total Return = ₹35 = 35%	Suppose you buy a share at ₹100. After one year, the price rises to ₹130. That ₹30 increase — the gain from the price at which you bought the share — is your capital appreciation. If the company also paid a ₹5 dividend, your total return is ₹35 on a ₹100 investment — that's 35%.
4	RYO	Ryo — key insight on growth	Dividends: Limited Capital Appreciation: THEORETICALLY UNLIMITED → Equity = Growth Asset	Here's the important insight: dividends are usually limited. But capital appreciation is theoretically unlimited. That's why equity is considered a growth asset.
5	MOTION	Debt vs Equity return comparison — flat line (debt) vs variable upward line (equity)	DEBT: Fixed interest — capped returns EQUITY: Variable, uncertain — potentially higher	Unlike debt — which gives fixed interest — equity gives variable, uncertain, but potentially higher returns. And that uncertainty is risk.
6	RYO	Ryo — residual claimant reminder	Equity holders = Residual Claimants Paid AFTER debt holders → Higher Risk → Higher Expected Return	Equity holders are residual claimants. They get paid after debt holders. Which is why equity is riskier. But because it is riskier — it also offers higher expected return over the long term. Note: returns are not guaranteed; capital depreciation is also possible.
7	ARIA	Aria — bridge to macro role of equity	NEXT: Ownership, participation, and the economy	But returns are only one part of the story. The deeper reason equity matters is ownership. Let's explore that.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.5 Video 2 — EAR: RELATE | Ownership & Capital Market Role

D4.5 · Video 2 of 2

Equity's Role in Capital Markets — EAR: RELATE

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.5-B
UOR Title	Equity as an Asset Class
Competency	Equity Returns & Risk
Sub-competencies	SC5.2 — Relate equity to economic growth
EAR Focus	RELATE — Equity ownership, economic growth, capital formation
Video Objective	Explain ownership participation Relate equity to economic growth Connect investor participation to capital formation
Prerequisite	UOR D4.5-A
Leads To	UOR D4.6-A — Depository Receipts (ADR/GDR)

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	RYO	Ryo in slightly more macro tone — wider framing	EQUITY: MORE THAN JUST RETURNS	Equity is not just a return-generating instrument. It represents ownership.
2	MOTION	Ownership participation — 4 icons fan out: Profits Voting Rights Growth Strategic Direction	WHEN YOU BUY EQUITY, YOU PARTICIPATE IN: • Profits • Voting rights • Growth • Strategic direction (via voting rights)	When you buy equity, you are buying a share in the company. You participate in profits, voting rights, growth, and strategic direction — meaning you have the ability to influence company decisions through your votes.

3	BOTH	Ryo and Aria side by side — Ryo: 'Debt is a contract', Aria: 'Equity is participation'	DEBT = A Contract EQUITY = Participation	This is fundamentally different from debt. Debt is a contract. Equity is participation.
4	MOTION	Zoom out — macro ecosystem animation: Entrepreneurs → Companies → Markets → Economy	EQUITY ENABLES: • Capital formation • Business expansion • Innovation funding • Economic growth	Now think larger. Why is equity a core capital market instrument? Because equity enables capital formation, business expansion, innovation funding, and economic growth.
5	RYO	Ryo — equity suitable for growth stages	EQUITY IS SUITED FOR: • Startups • High-growth companies • Expansion phases	When companies issue equity, they are not increasing fixed obligations. They are sharing ownership risk. This makes equity suitable for startups, high-growth companies, and expansion phases.
6	MOTION	Connection chain animation: Entrepreneurs ↔ Investors ↔ Markets ↔ Economic Development	EQUITY CONNECTS: Entrepreneurs → Investors → Markets → Economy	So equity connects entrepreneurs to investors, investors to markets, and markets to economic development. Without equity, there is no scalable risk capital. And without risk capital, innovation slows down.
7	ARIA	Aria — strong closing and bridge	Equity is the BACKBONE of modern capital markets NEXT: Depository Receipts — taking equity global	That's why equity is not just another asset class. It is the backbone of modern capital markets. Next — we'll see how equity crosses borders through Depository Receipts.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.6 Video 1 — EAR: IDENTIFY | Depository Receipt Structure

Depository Receipt Structure — EAR: IDENTIFY

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.6-A
UOR Title	Depository Receipts (ADR/GDR)
Competency	Global Equity Instruments
Sub-competencies	SC6.1 — Identify DR structure
EAR Focus	IDENTIFY — DR definition, depository bank role, ADR vs GDR structure
Video Objective	Identify what a Depository Receipt is Understand the role of a depository bank Distinguish ADR vs GDR structurally
Prerequisite	UOR D4.5-B
Leads To	UOR D4.6-B — Why DRs Exist

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Depository Receipts' — globe with receipt document animation India → US flow animation	DEPOSITORY RECEIPTS (ADR / GDR) D4.6 Video 1 of 3	Let's imagine an Indian company wants investors in the United States to buy its shares. But here's the problem.
2	RYO	Ryo with problem framing — 3 barriers animate in	THE PROBLEM: • Indian shares listed in India • Denominated in INR • Follow Indian settlement systems	Indian shares are listed in India. They are denominated in INR. They follow Indian settlement systems. How can a US investor easily buy them?

3	MOTION	3-layer flow animation: Company → Custodian Bank → Depository Bank → Foreign Investors Each layer pops in with arrow connecting them	HOW DRs WORK: ① Company deposits shares with custodian bank (home country) ② Depository bank (foreign country) issues receipts ③ Foreign investors buy and trade those receipts	That's where Depository Receipts come in. A DR is a negotiable certificate issued by a foreign bank representing shares of a non-domestic company. Here's how it works: the company deposits shares with a custodian bank at home. A depository bank abroad issues receipts representing those shares. Foreign investors buy and trade those receipts — not the original shares.
4	MOTION	ADR label appears over US map, GDR label over Europe/international map	ADR: Listed in the UNITED STATES GDR: Listed in EUROPE or international markets	Depending on where the receipt is listed: if listed in the United States — it's called an ADR, American Depository Receipt. If listed in Europe or other international markets — it's called a GDR, Global Depository Receipt.
5	RYO	Ryo — ADR vs GDR distinction — 3 differences	ADR vs GDR — DIFFERENCE: Geography Regulatory Framework Exchange of Listing	Structurally, ADRs and GDRs are similar. The difference lies mainly in geography, regulatory framework, and the exchange of listing.
6	ARIA	Aria — bridge to why companies do this	NEXT: But WHY do companies bother?	Structure is clear. But why do companies even bother doing this? That's what we'll explore next.

► MICRO-VIDEO TRANSITION

UOR Title	Depository Receipts (ADR/GDR)
Competency	Global Equity Instruments
Sub-competencies	SC6.2 — Explain DR issuance rationale
EAR Focus	EXPLAIN — Why companies issue DRs, investor benefits, global capital access
Video Objective	Explain why companies issue ADRs/GDRs Explain benefits to investors Relate DRs to global capital access
Prerequisite	UOR D4.6-A
Leads To	UOR D4.6-C (NEW) — Sponsored vs Unsponsored DRs

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	RYO	Ryo in strategic mode — company perspective	WHY WOULD A COMPANY ISSUE DRs? Capital is global.	Why would a company issue Depository Receipts? Because capital is global. If a company limits itself to domestic investors — its access to funding is limited.
2	MOTION	4 company benefits animate in with globe/growth icons	COMPANY BENEFITS: ✓ Access larger investor base ✓ Improve global visibility ✓ Increase liquidity	By issuing ADRs or GDRs, companies can access a larger investor base, improve global visibility, increase liquidity, and potentially reduce their cost of capital.

			✓ Potentially reduce cost of capital	
3	BOTH	Aria — investor perspective, Ryo — company perspective	INVESTOR PERSPECTIVE: Why prefer DRs?	Now think from the investor's perspective. Why would investors prefer DRs instead of directly buying foreign shares?
4	MOTION	4 investor benefit icons: Home currency Settlement Regulatory Complexity	INVESTOR BENEFITS: ✓ Trade in home currency ✓ Familiar settlement systems ✓ Local regulatory compliance ✓ Reduced operational complexity	Because DRs trade in their home currency. They follow familiar settlement systems. They comply with local regulatory frameworks. And they reduce operational complexity. DRs remove friction.
5	RYO	Ryo — deeper insight delivery	DRs bridge geographic markets Capital from one country → Growth in another	Depository Receipts help integrate global capital markets. They enable capital from one country to fund growth in another. That is why DRs exist — not because companies want to appear international, but because capital naturally flows across borders.
6	ARIA	Aria — bridge to sponsored vs unsponsored	NEXT: Not all DRs are the same — Sponsored vs Unsponsored	But not all Depository Receipts are created equally. There's an important distinction you need to know — sponsored versus unsponsored DRs.

► MICRO-VIDEO TRANSITION

Leads directly to: D4.6 Video 3 (NEW) — Sponsored vs Unsponsored DRs

D4.6 (NEW) · Video 3 of 3 — NEW CONTENT

Sponsored vs Unsponsored DRs

NEW NEW CONTENT — Developed to fill identified gap

 INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.6-C (NEW)
UOR Title	Depository Receipts (ADR/GDR)
Competency	Global Equity Instruments
Sub-competencies	SC6.3 (New) — Distinguish sponsored from unsponsored DRs
EAR Focus	DIFFERENTIATE — Sponsored vs Unsponsored Depository Receipts
Video Objective	Differentiate sponsored from unsponsored DRs Understand investor implications of each Identify which type is more transparent
Prerequisite	UOR D4.6-B
Leads To	UOR D4.7-A — Risks of Equity Investing

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Sponsored vs Unsponsored DRs' — two contrasting pathways animate	SPONSORED vs UNSPONSORED DRs D4.6 Video 3 — New Content	Not all Depository Receipts are the same. The key distinction is whether the company itself is involved in the creation of the DR.
2	RYO	Ryo — sponsored side, company-initiated path	SPONSORED DRs: Company formally initiates the DR programme Files with regulators (e.g. SEC in the US) Single depository bank appointed	In a Sponsored DR — the company formally initiates the Depository Receipt programme. It files with regulators, appoints a single depository bank, and provides full financial disclosures. The company has agreed to this arrangement.

			Company provides financial disclosures	
3	MOTION	Sponsored DR flow — Company → Regulator → Single Depository Bank → Investors More structured, transparent pathway visual	SPONSORED DR: More transparent Regulatory disclosure Company-initiated Single depository bank	Sponsored DRs are more transparent. Investors can access the company's financial statements, annual reports, and regulatory filings. This is the preferred form for serious institutional investors.
4	ARIA	Aria — explains un-sponsored with slight surprise expression	UNSPONSORED DRs: Created WITHOUT company involvement Third-party banks initiate independently Multiple depository banks may exist Limited financial disclosure	Un-sponsored DRs are different. Here, a third-party depository bank creates the DR programme without the company's involvement or agreement. Multiple banks may create un-sponsored DRs on the same foreign company — independently.
5	MOTION	Comparison table: Sponsored vs Un-sponsored — 4 rows	SPONSORED vs UNSPONSORED: Initiation: Company vs Third-party bank Regulation: Fully filed vs Limited Disclosure: Full vs Minimal Depository Banks: Single vs Multiple possible	To compare: Sponsored DRs are initiated by the company, fully regulated, with complete disclosure and a single appointed depository bank. Un-sponsored DRs are initiated by third parties, have limited regulation, minimal disclosure, and can have multiple depository banks.
6	RYO	Ryo — investor implication	INVESTOR IMPLICATION: Sponsored = More information = Better for due diligence Un-sponsored = Less information = Higher uncertainty	For investors, sponsored DRs offer more information and are better for due diligence. Un-sponsored DRs carry higher uncertainty due to limited disclosure. Institutional investors generally prefer sponsored programmes.
7	ARIA	Aria — bridge to risk module	NEXT: Risks of Equity Investing	We've covered how equity works, how it's structured, and how it crosses borders. Now let's face an important reality — equity comes with risk. Let's identify what those risks are.

EAR Focus	IDENTIFY — Market (systematic) risk, macro-level risk drivers
Video Objective	Identify market (systematic) risk Recognise macro-level risk drivers Understand why it affects all stocks
Prerequisite	UOR D4.6-C
Leads To	UOR D4.7-B — Business Risk

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	RYO	Ryo in calm, analytical tone — stock market backdrop fades in	MARKET RISK (Systematic Risk) D4.7 Video 1 of 2	Let's begin with a simple observation. Have you noticed days when almost every stock falls together — even strong companies, even profitable companies?
2	MOTION	Market downturn animation — many company icons all flash red simultaneously	ALL STOCKS FALL TOGETHER That is MARKET RISK	That is market risk, also known as systematic risk — the risk that affects the entire market simultaneously, driven by broad macroeconomic and geopolitical factors that no individual company can control.

3	MOTION	5 macro factor icons appear: Interest Rates Inflation Recession Political Global Events	MARKET RISK DRIVEN BY: • Interest rate changes • Inflation • Economic recession • Political instability • Global events	It is driven by macro factors such as: interest rate changes, inflation, economic recession, political instability, and global events.
4	RYO	Ryo — worked example (rate hikes)	EXAMPLE: Central Bank raises interest rates → Borrowing costs rise → Future profits discounted more → Market declines broadly	For example: when central banks increase interest rates, borrowing becomes expensive, future profits are discounted more heavily, and stock markets often decline broadly — even for well-managed companies.
5	MOTION	Diversification visual — adding more stocks does NOT remove market risk bar	MARKET RISK CANNOT be eliminated by diversification It affects all stocks simultaneously	This is the critical point: market risk is systematic. It cannot be eliminated by simply holding more stocks. If the market drops 10% — most portfolios will decline.
6	ARIA	Aria — bridge to business risk	NEXT: Not all risk is macro — Business Risk	But not all risks are macro. Some risks are specific to individual companies. That's where business risk comes in.

Business Risk — EAR: EXPLAIN

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.7-B
UOR Title	Risks of Equity Investing
Competency	Equity Risk Reasoning
Sub-competencies	SC7.2 — Explain unsystematic risk
EAR Focus	EXPLAIN — Business risk, diversifiable risk, contrast with market risk
Video Objective	Identify business risk Explain how it differs from market risk Understand diversifiable risk
Prerequisite	UOR D4.7-A
Leads To	UOR D4.8-A — Market Behaviour: Liquidity

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Title: 'Business Risk — Unsystematic Risk' — single company icon highlighted	BUSINESS RISK (Unsystematic Risk) D4.7 Video 2 of 2	Now imagine a different scenario.
2	ARIA	Aria narrating a scenario — expressive storytelling mode	SCENARIO: One company's product fails Market remains stable. But THIS stock falls 25%.	A company launches a new product. The product fails. Revenue declines. The stock falls 25%. But the overall market remains stable. This is business risk.
3	MOTION	Business risk factor icons: Management	BUSINESS RISK ARISES FROM:	Business risk is specific to a company. It arises from poor management decisions, competitive pressures,

		Competition Operations Legal Governance	• Poor management decisions • Competitive pressures • Operational failures • Legal penalties • Governance issues	operational failures, legal penalties, and governance issues. Unlike market risk, it does not affect all companies equally.
4	RYO	Ryo — diversification solution	BUSINESS RISK CAN BE REDUCED Through DIVERSIFICATION	And here's the key distinction: business risk can be reduced through diversification. If you hold shares across different companies and industries — a failure in one may not significantly impact your entire portfolio.
5	MOTION	Final summary comparison — two columns: Market Risk vs Business Risk	MARKET RISK — Systematic: Affects entire market Cannot diversify Macro forces BUSINESS RISK — Unsystematic: Specific to company Can diversify Operational decisions	To summarise: market risk — systematic — affects the entire market, cannot be diversified away, driven by macroeconomic forces. Business risk — unsystematic — specific to a company, can be diversified, driven by operational and strategic decisions.
6	RYO	Ryo — closing the risk module with asset class link	Both risks exist in equity investing → Higher risk = Higher expected returns vs safer assets	Both risks exist in equity investing. And because these risks exist — equities offer higher expected returns compared to safer assets like bonds. Risk and return are connected. That is why equity is a high-risk, high-return asset class.
7	ARIA	Aria — bridge to market behaviour	NEXT: Market Behaviour — Liquidity, Volatility & Indices	Now let's understand how equity markets actually behave — through three key concepts: liquidity, volatility, and indices.

UOR Title	Intro to Market Behaviour
Competency	Market Behaviour Literacy
Sub-competencies	SC8.1 — Explain liquidity in equity markets
EAR Focus	EXPLAIN — Liquidity meaning, high vs low liquidity, why liquidity matters
Video Objective	Explain what liquidity means in equity markets Identify high vs low liquidity Understand why liquidity matters
Prerequisite	UOR D4.7-B
Leads To	UOR D4.8-B — Volatility

PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	ARIA	Aria with relatable everyday analogy — casual but precise	LIQUIDITY D4.8 Video 1 of 3	Let's start with a simple question. If you want to sell your mobile phone today — how quickly can you sell it? Maybe it takes days.
2	MOTION	Phone icon (slow sell) vs Reliance share icon (instant sell) — time bar contrast animation	Sell phone: Days Sell ₹1,000 of Reliance shares: Seconds That difference = LIQUIDITY	Now imagine selling ₹1,000 worth of Reliance shares. It takes seconds. That difference is liquidity.
3	RYO	Ryo — precise definition	LIQUIDITY = How easily an asset can be bought or sold	Liquidity refers to how easily and quickly an asset can be bought or sold without significantly affecting its price.

			without significantly affecting its price	
4	MOTION	High Liquidity panel vs Low Liquidity panel — contrasting icons	HIGH LIQUIDITY: • Many buyers and sellers • Tight bid-ask spreads • Easy entry and exit LOW LIQUIDITY: • Few participants • Large price swings for small trades • Difficulty exiting positions	High liquidity means: many buyers and sellers, tight bid-ask spreads, and easy entry and exit. Low liquidity means: few participants, large price swings for small trades, and difficulty exiting positions.
5	RYO	Ryo — deeper connection to capital formation	LIQUIDITY → Investor confidence → Capital formation	Liquidity reduces transaction risk. Without liquidity, investors would hesitate to invest in the first place. Liquidity supports capital formation.
6	ARIA	Aria — bridge to volatility	NEXT: Volatility — why do prices move?	But liquidity alone does not explain price movement. That brings us to volatility.

Volatility — EAR: EXPLAIN

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.8-B
UOR Title	Intro to Market Behaviour
Competency	Market Behaviour Literacy
Sub-competencies	SC8.2 — Explain volatility and differentiate from risk
EAR Focus	EXPLAIN — Volatility meaning, difference from risk, price movement and uncertainty
Video Objective	Explain what volatility means Differentiate volatility from risk Recognise how price movement reflects uncertainty
Prerequisite	UOR D4.8-A
Leads To	UOR D4.8-C — Indices

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	MOTION	Volatile stock chart animation — sharp ups and downs — 5% single day move highlighted	VOLATILITY D4.8 Video 2 of 3	Have you ever seen a stock move 5% in one day? That's volatility.
2	RYO	Ryo — analytical, precise tone	VOLATILITY = Degree of price fluctuation over time	Volatility refers to the degree of price fluctuation over time.
3	MOTION	High vs Low volatility chart comparison side by side	HIGH VOLATILITY: Large swings Greater uncertainty	High volatility: large price swings, greater uncertainty, higher perceived risk. Low volatility: stable price movement, predictable range, lower uncertainty.

			Higher perceived risk LOW VOLATILITY: Stable movement Predictable range Lower uncertainty	
4	ARIA	Aria — important clarification with emphasis	VOLATILITY ≠ RISK Volatility: price movement Risk: potential PERMANENT loss	Now here's an important clarification. Volatility is not the same as risk. Volatility measures price movement. Risk refers to potential permanent loss. A stock can be volatile but fundamentally strong.
5	MOTION	3 volatility trigger icons: Earnings Policy Changes Geopolitical Events	EVENTS THAT INCREASE VOLATILITY: • Earnings announcements • Economic policy changes • Geopolitical events	Events that increase volatility include: earnings announcements, economic policy changes, and geopolitical events.
6	RYO	Ryo — summary contrast before bridge	LIQUIDITY: How easily you can TRADE VOLATILITY: How much PRICES MOVE	Liquidity describes how easily you can trade. Volatility describes how much prices move. But how do we measure overall market movement? That's where indices come in.

Indices — EAR: RELATE

INTERNAL USE ONLY — Mapping Reference	
Field	Details
UOR Code	UOR D4.8-C
UOR Title	Intro to Market Behaviour
Competency	Market Behaviour Literacy
Sub-competencies	SC8.3 — Relate index movement to market sentiment
EAR Focus	RELATE — Stock index definition, market sentiment, benchmark function
Video Objective	Explain what a stock index is Relate index movement to overall market sentiment Understand why indices are benchmarks
Prerequisite	UOR D4.8-B
Leads To	MODULE COMPLETE — D4 Equity

 PRODUCTION SCRIPT

#	Character	Visual Cue / Animation	On-Screen Text	Voice Over Script
1	ARIA	Aria with news ticker-style animation — 'market up 2%'	'The market was up 2% today.' What does that mean? D4.8 Video 3 of 3	If someone says 'the market was up 2% today' — what does that mean? It usually refers to a stock index.
2	RYO	Ryo — precise definition	STOCK INDEX = Basket of selected stocks representing broader market performance	A stock index is a basket of selected stocks that represents the performance of a broader market.

3	MOTION	3 index cards appear: Sensex (30 stocks) Nifty 50 (50 stocks) S&P 500 (500 stocks) Add: NASDAQ-100 Indices label	EXAMPLES: Sensex: 30 major Indian companies Nifty 50: 50 large Indian companies S&P 500: 500 major US companies NASDAQ-100: 100 major tech-focused companies	Examples: Sensex tracks 30 major companies in India. Nifty 50 tracks 50 large companies. S&P 500 tracks 500 major US companies. And NASDAQ-100 covers major tech-focused companies.
4	MOTION	3 purpose icons animate in: Performance Benchmark Sentiment	INDICES SERVE 3 PURPOSES: ① Measure overall market performance ② Act as benchmarks for fund managers ③ Reflect market sentiment	Indices serve three purposes: measure overall market performance, act as benchmarks for fund managers, and reflect market sentiment.
5	RYO	Ryo — index movement interpretation	Index RISES → Major companies gained value Index FALLS → Broader negative sentiment	When an index rises — it indicates that, on average, major companies have gained value. When it falls — it reflects broader negative sentiment.
6	BOTH	Both Ryo and Aria — final module wrap-up, energetic closing	BRINGING IT TOGETHER: Liquidity → supports trading Volatility → reflects price movement Indices → summarise market behaviour Together: this is how equity markets behave	Now relate this back: liquidity supports trading. Volatility reflects price movement. Indices summarise market behaviour. Together — they define how equity markets behave.
7	MOTION	Module D4 completion card — all UOR codes listed with checkmarks Celebration animation — subtle confetti	MODULE D4 COMPLETE ✓ D4.1 D4.2 D4.3 D4.4 D4.5 D4.6 D4.7 D4.8 You now understand: Equity — from ownership to markets	You've completed Module D4 — Equity. From what equity is, to how it's structured, how it's traded, how it's valued, and how markets behave. Well done.
